5.0 SAR MEASUREMENT SYSTEM

Celltech Labs Inc. SAR measurement facility employs a Dosimetric Assessment System (DASY™) manufactured by Schmid & Partner Engineering AG (SPEAG™) of Zurich, Switzerland. The DASY4 measurement system is comprised of the measurement server, a robot controller, a computer, a near-field probe, a probe alignment sensor, an Elliptical Planar Phantom (ELI) phantom and a specific anthropomorphic mannequin (SAM) phantom for Head and/or Body SAR evaluations. The robot is a six-axis industrial robot performing precise movements to position the probe to the location (points) of maximum electromagnetic field (EMF). A cell controller system contains the power supply, robot controller and a teach pendant (Joystick) to control the robot's servo motors. The Staubli robot is connected to the cell controller to allow software manipulation of the robot. A data acquisition electronic (DAE) circuit performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. is connected to the Electro-optical coupler (EOC). The EOC performs the conversion from the optical form the DAE to digital electronic signal and transfers data to the DASY4 measurement server. The DAE4 utilizes a highly sensitive electrometer-grade preamplifier with auto-zeroing, a channel and gain-switching multiplexer, a fast 16-bit AD-converter, a command decoder and a control logic unit. Transmission to the DASY4 measurement server is accomplished through an optical downlink for data and status information and an optical uplink for commands and clock lines. The mechanical probe-mounting device includes two different sensor systems for frontal and sidewise probe contacts. The sensor systems are also used for mechanical surface detection and probe collision detection. The robot utilizes a controller with built in VME-bus computer.

| 7-FRS | 462.7125 | 26.63 | 27.00 | 0.50 | -0.37 | Υ | 14-GMRS | 27.45 | 27.80 | 0.60 | -0.35 | N |
| 8-FRS | 467.5625 | 26.39 | 27.00 | 0.50 | -0.61 | N | | | | | | |
| 14-FRS | 467.7125 | 26.37 | 27.00 | 0.50 | -0.63 | Υ | | | · | | | |
| | | | | | | Notes: | | | | | | |

The Conducted Power of the DUT was measured at the antenna port, with a fully charged battery and transmitting at 100% duty cycle.

7.0 NUMBER OF TEST CHANNELS (N_c) (HOST TRANSCEIVER)

| Table 7.0 | | | | | | | |
|------------------|-------------------|----------------|-------------------|----------------------|---------|-----------|--|
| | | Number | of Required | Test Chann | els | | |
| | Frequency | | Number of | f Channels | Spacing | | |
| f _{LOW} | f _{HIGH} | f _C | KDB 447498 | KDB 447498 IEC 62209 | | IEC 62209 | |
| (MHz) | (MHz) | (MHz) | (N _C) | (N _C) | (MHz) | (MHz) | |
| 462.5625 | 467.7125 | 465.1375 | 2 | 3 | 5.1 | 2.6 | |

KDB 447498: N_C = RoundUp { [100 ($F_{HIGH} - F_{LOW}$)/Fc]^{0.5} X (F_C /100)^{0.2} }

IEC 62209-1: N_C = 2 X { RoundUp [10 (F_{HIGH} - F_{LOW}) / F_C] } + 1

Notes:

Since the FRS band is broken into two distinct channel groups, 462MHz and 467MHz, and since the GMRS channels of this device only transmit on certain channels of the FRS 462MHz channels, two channels of the 462MHz and one channel of the 467MHz channel groups were chosen. See Section 6.0 Conducted Power for channel selection.

8.0 ACCESSORIES EVALUATED (HOST TRANSCEIVER)

The AWIRE AW1001 is supplied an integral non-removable belt clip and a means to plug in any third part headset with a 3.5mm headset jack. A typical third party headset was used during this SAR evaluation.

Test Report S/N:

^{*} Worst case SAR evaluated for all configurations.

Note: The BlueTooth DTS Mode transmits at 7.35mW which falls below the SAR Test Exclusion Threshold as per KDB 447498. Only the DSS Mode is considered contribution SAR contribution as it exceeds the Exclusion Threshold. The calculated SAR of the DTS Mode is less than the measured SAR of the DSS Mode. The DTS Mode does not simultaneously transmit with the DSS Mode.

45461372R1.1

14 November 2016

NOTES to Table 10.0

(1) Scaling of the Maximum Measured SAR is based on the highest, 100% duty cycle, Face, Body and/or Head SAR measured of ALL test channels, configurations and accessories used during THIS evaluation. The Measured Fluid Deviation parameters apply only to deviation of the tissue equivalent fluids used at the frequencies which produced the highest measured SAR. The Measured Conducted Power applies to the Conducted Power measured at the frequencies producing the highest Face and Body SAR. The Measured Drift is the SAR drift associated with that specific SAR measurement. The Reported SAR is the accumulation of all SAR Adjustments from the applicable Steps 1 through 4. The Plot ID is for indentification of the SAR Measurement Plots in Annex A of this report.

NOTE: Some of the scaling factors in Steps 1 through 4 may not apply and are identified by light gray text.

Step 1

Per IEC-62209-1 and FCC KDB 865664. Scaling required only when Measured Fluid Deviation is greater than 5%. If the Measured Fluid Deviation is greater than 5%, Table 10.1 will be shown and will indicate the SAR scaling factor in percent (%). SAR is MULTIPLIED by this scaling factor only when the scaling factor is positive (+).

Step 2

Per KDB 447498. Scaling required only when the difference (Delta) between the Measured Conducted Power and the Manufacturer's Rated Conducted Power is (-) Negative The absolute value of Delta is ADDED to the SAR.

Step 3

Per KDB 447498 4.3.2. The SAR, either measured or calculated, of ANY and ALL simultaneous transmitters must be added together and includes all contributors.

Step 4

Per IEC 62209-1. Scaling required only when Measured Drift is (-) Negative. The absolute value of Measured Drift is added to Reported or Simultaneous Reported SAR.

Step 5

The Reported SAR is the Maximum Final Adjusted Cumulative SAR from the applicable Steps 1 through 4 and are reported on Page 1 of this report.

| Table 10.1 | | | | | | | | | |

| Scaling of SAR only required for Positive ΔSAR | | | | | | | | | |

I attest that the data reported herein is true and accurate within the tolerance of the Measurement Instrument Uncertainty; that all tests and measurements were performed in accordance with accepted practices or procedures; and that all tests and measurements were performed by me or by trained personnel under my direct supervision. The results of this investigation are based solely on the test sample(s) provided by the client which were not adjusted, modified or altered in any manner whatsoever, except as required to carry out specific tests or measurements. This test report has been completed in accordance with ISO/IEC 17025.

11.0 SAR EXPOSURE LIMITS

| Table 11.0 | | | | |
|-------------------------------------|---------------|------------------------|----------------------|--|
| | SAR RF E | XPOSURE LIMITS | | |
| | Health Canada | (General Population / | (Occupational / | |
| FCC 47 CFR 2.1093 | Safety Code 6 | Uncontrolled Exposure) | Controlled Exposure) | |
| Spatial Ave (averaged over the | _ | 0.08 W/kg | 0.4 W/kg | |
| Spatial P (averaged over any | | 1.6 W/kg | 8.0 W/kg | |
| Spatial P (hands/wrists/feet/ankles | | 4.0 W/kg | 20.0 W/kg | |

The Spatial Average value of the SAR averaged over the whole body.

The Spatial Peak value of the SAR averaged over any 1 gram of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time.

The Spatial Peak value of the SAR averaged over any 10 grams of tissue (defined as a tissue volume in the shape of a cube) and over the appropriate averaging time.

Uncontrolled environments are defined as locations where there is potential exposure to individuals who have no knowledge or control of their potential exposure.

Controlled environments are defined as locations where there is potential exposure to individuals who have knowledge of their potential exposure and can exercise control over their exposure.

12.0 DETAILS OF SAR EVALUATION

| | EVALUATION DETAILS |
|---|--|
| 1 | The number of test channels and test configurations performed on this accessory were based on the antenna-configuration combinations which produced the highest, or worst case, SAR from previous SAR evaluations performed on the transceiver. Table 6.0 identifies those test channels and each channel was tested in the Body and Face configuration. |
| 2 | The DUT was evaluated for SAR in accordance with the procedures described in IEEE 1528, FCC KDB 865646 and RSS-102. |
| 3 | The DUT was evaluated for SAR at the maximum conducted output power level, preset by the manufacturer, in unmodulated continuous transmit operation (Continuous Wave mode at 100% duty cycle) with the transmit key continuously depressed. For a Push-To-Talk (PTT) device, the 50% duty cycle compensation reported assumes a transmit/receive cycle of equal time base. |
| 4 | A single point SAR measurement was taken prior to the Area Scan and after the Zoom Scan and the SAR drift of the DUT was evaluated. The measured SAR drift was added to the measured SAR levels of the Maximum <u>reported</u> SAR (IC/EU only). |
| 5 | Each SAR evaluations were performed with a fully charged battery. |
| 6 | The fluid temperature remained within +/-2°C from the time of the fluid dielectric parameter measurement to the completion of the SAR evaluation. |
| 7 | The fluid temperature remained within +/-0.5°C throughout the test day. |

| SCAN PROCEDURE | | | | | | | |
|--|--------------------|--|--|--|--|--|--|
| Maximum distance from the closest measurement point to phantom surface. | 4 ± 1mm | | | | | | |
| Maximum probe angle normal to phantom surface. | 5° ± 1° | | | | | | |
| Area Scan Spatial Resolution ΔX, ΔY | 15mm | | | | | | |
| Zoom Scan Spatial Resolution ΔX , ΔY | 7.5mm | | | | | | |
| Zoom Scan Spatial Resolution ΔZ | 5mm | | | | | | |
| Zoom Scan Volume X, Y, Z | 30mm x 30mm x 30mm | | | | | | |
| Phantom | SAM | | | | | | |
| Fluid Depth | 150mm | | | | | | |
| An Area Scan with an area extending beyond the device was used to locate the | | | | | | | |

An Area Scan with an area extending beyond the device was used to locate the candidate maximas within 2dB of the global maxima.

A Zoom Scan centered over the peak SAR location(s) determined by the Area Scan was used to determine the 1 gram and 10 gram peak spatial-average SAR

Prior to the SAR evaluations, system checks were performed on the planar section of the phantom and a SPEAG validation dipole in accordance with the procedures described in IEEE 1528-2013, FCC KDB 846224 and IEC 62209-1. The dielectric parameters of the simulated tissue mixture were measured prior to the system performance check using a Dielectric Probe Kit and a Network Analyzer (see Section "Fluid Dielectric Parameters"). The forward power was applied to the dipole and the system was verified to a tolerance of +10% from the system manufacturer's dipole calibration target SAR value (see Appendix "Dipole Calibration" for system manufacturer's dipole calibration procedures).

- (1) The Forward Power applied to the Validation Source during this System Verification is the Forward Power applied by the manufacturer during the calibration of this validation source.
- (2) The Target SAR values are the SAR values that were measured using the Forward Power indicated above by the manufacture during the calibration of this validation source.
- (3) Based on manufacturer's 1W Normalized SAR during the calibration of this validation source.

Prior to the SAR evaluations, system checks were performed on the planar section of the phantom and a SPEAG validation dipole in accordance with the procedures described in IEEE 1528-2013, FCC KDB 846224 and IEC 62209-1. The dielectric parameters of the simulated tissue mixture were measured prior to the system performance check using a Dielectric Probe Kit and a Network Analyzer (see Section "Fluid Dielectric Parameters"). The forward power was applied to the dipole and the system was verified to a tolerance of +10% from the system manufacturer's dipole calibration target SAR value (see Appendix "Dipole Calibration" for system manufacturer's dipole calibration procedures).

- (1) The Forward Power applied to the Validation Source during this System Verification is the Forward Power applied by the manufacturer during the calibration of this validation source.
- (2) The Target SAR values are the SAR values that were measured using the Forward Power indicated above by the manufacture during the calibration of this validation source.
- (3) Based on manufacturer's 1W Normalized SAR during the calibration of this validation source.

Phantom Specification

The ELI V5.0 phantom is an elliptical planar fiberglass shell phantom with a shell thickness of 2.0mm +/- .2mm at the planar area. This phantom conforms to OET Bulletin 65, Supplement C, IEEE 1528-2013, IEC 62209-1 and IEC 62209-2.

ELI Phantom

Device Positioner Specification

The DASY4 device positioner has two scales for device rotation (with respect to the body axis) and the device inclination (with respect to the line between the ear openings). The plane between the ear openings and the mouth tip has a rotation angle of 65°. The bottom plate contains three pair of bolts for locking the device holder. The device holder positions are adjusted to the standard measurement positions in the three sections.
